

Bank Risk Classification System

Introduction

The **RISKbank**[©] will guide you into the difficult task of matching risk and return in adequate levels. Our proposal is to introduce a new methodology to measure bank risk, which takes into account not only the traditional objective analysis but also intangible factors in order to help define the credit and operational limits for each bank.

This is only possible by the consolidation of specific knowledge and experience of Lopes Filho & Associados - Investment Consultants developed in 37 years of financial institutional analysis.

Product Characteristics

✓ UNIVERSE

The comparison basis involves 90 banks, commercial and multiple, private and public, foreign and national, classified by their size. This universe can be increased according to the clients needs.

✓ FREQUENCY

The classification data required will be updated as soon as the information is available, which occurs regularly every quarter.

✓ SERVICES

Besides the classification, there is a thorough follow up, which assures the client that any alteration extra-balance sheet, suspicious irregularities or any other relevant fact that may occur and suggest possible change in the **RISKbank**[©] Risk Classification, will be considered and re-classified.

For each quarter, attached to **RISKbank**[©], there will be a brief analysis of the financial sector, with interesting comments. The **RISKbank**[©] Index can be used in the determination of adequate credit limits.

A General View of RISKbank@

RISKbank[©] is an association of balance sheet, sectorial and statistic analysis techniques with the empirical knowledge of how financial institutions work and their operational characteristics. The final result is a clear view of objective factors of each bank performance in time, plus the subjective factors capable of rising possible concerns in the most sensitive areas and major impact to the bank's financial health.

0 Objective Analysis (Quantitative)

The objective analysis includes the usage of 10 indicators widely accepted as the most efficient ones in measuring the risk of financial institutions.

These indicators are subject to a statistical treatment, which provides the uniformization of the series, eliminating distortions (average and standard error) and coming to standard results. From the ponderation of the results we get the **RISKbank**[©] index for each institution, so that it can be ranked and classified among the other institutions of its group.

2 Previous Classification By Size

Besides the ten indicators previously mentioned, the banks are pre-classified by size, represented by the total assets. We avoid the comparison between institutions of different sizes, which usually corresponds to different levels of risk. We call this the *inner risk*, that is to say, the fact of being small in assets, makes the institution more vulnerable to cash flow variations, bringing the necessity of offering better conditions to the clients in order to keep the balance of assets and liabilities.

9 Warning Columns

Indicators correspond to maximum and minimum limits. If any of them is trespassed, an alarm should ring to warn that some kind of adjustment must be done in the institution in order to return to an adequate level. These columns are useful to evaluate the bank risk related to itself, not to the others as it happens in the general classification.

O Subjective Analysis (Qualitative)

The subjective analysis is an important additional criterion to analyze the risk of the banks. These techniques allow us to do more specific and conservative analysis considering the subjective aspects, as follows: RELIABILITY OF INFORMATION; MEMBERSHIP SUPPORT; OWNERSHIP/CORPORATE STRUCTURE; MANAGEMENT PERFORMANCE; ASSET/LIABILITY CONTROL; FUTURE DEVELOPMENTS; MACROECONOMIC ENVIRONMENT; TECHNOLOGY; AND SO ON.

O Risk Classification

The noblest part, however, is small but of fundamental relevance. It addresses the RISK CLASSIFICATION. These are few words, but transform themselves in the essence of RISKbank[®]. By having all information and analysis, an expert committee of diversified background discusses each assessment, which confirms or proposes their redefinition. Hence, the client has a clear and objective definition of the opinion on each bank, allowing it to use it or complement its own in a safe decision-making whether to invest its financial resources or not. Following, the Rating Scale created by the **RISKbank[©]** with its definitions.

Criteria and Major Indicators of RISKbank@

⊃LIQUIDITY

The banks operate with currency and credit, which are extremely volatile products. The simple possibility (not the fact itself) of having problems of liquidity (not having enough currency to honor the borrowings), is enough to put into risk the whole bank structure, should it be small, medium or large, public or foreign.

⊃FREE CASH

This indicator allows us to analyze the cash flow management policy of the bank. It is expressed by the Liquid Assets less the Interbank Deposits.

≎SOLVENCY

This index shows the structural problems a bank may have. When in association with the liquidity index, it can detect imminent problems of solvency, rarely solved by present mechanisms of exchanging bank reserves.

⊃ASSET QUALITY

The basic activity of a bank is to intermediate resources, capturing savings and generating credit operations. When a bank does not receive the payment of a loan, it may get into problems, which can seriously risk not only the present but also the future of the institution. Besides, it also suggests the incompetence of the bank in choosing its debtor clients.

PROFITABILITY (RETURN ON EQUITY / RETURN ON ASSET

Banks, just as any other institution in a capitalist system, in other words, works for profits. However, the **RISKbank**[©] takes into consideration, that low levels of profitability in a certain period of time may not represent a matter of concern, for in some cases they can be interpreted as strategy for changing the level of profitability in the future.

The subjective analysis provides an evaluation of each case, even though the statistic classification may negatively score fewer profitable banks.

OPERATING EXPENSES

This indicator shows how the financial result is used to afford the operational structure, in other words, how much the bank structure costs in relation to its own results generation in its basic activity.

⊃LEVERAGE

The activity of intermediating resources requires operating with an expressive level of loans compared to its own resources.

There isn't a standard relationship that shows if the leverage level is adequate or not to an institution. However, it can be figured out whether a leverage level is high or low, by comparing to existing legal limits and also to other similar financial institutions.

SASSETS CONCENTRATION / LIABILITY CONCENTRATION

This indicator is used to adequate the global analysis to conjunctural factors, providing a clearer view of the real situation of the institution.

For instance, if concentration in government bonds, foreign currency or credit should mean a risk increase, the indicator will help it to point it out.

≎RISK BASED ASSETS

The Central Bank of Brazil has changed its capital requirements since August 1994, when Brazil got into Basle Agreement. After that, the Central Bank has drafted its own interpretation of Bank for International Settlements' capital guidelines.

Now the banks´ capital adequacy is limited not only by their liability leverage level but also by their assets.

As this regulation may control the flexibility or growth of the system, the establishment of minimum capital levels is frequently an important rating consideration.

Ponderation Factors to the Indicators

The ponderation factors represent a personal assessment. They try to reflect an existing reality by pointing out the indicators that imply in higher risk level in some point in time. Because of that, they can be changed every moment, in relation to the economical and conjunctural factors, as well as the performance of the financial sector.

Conclusion

We believe that the **RISKbank**[©] will be of great value to you as it will help you to find the optimum allocation of your resources, and also identify the institutions which have been underestimated in potential, due to the lack of conditions to analyze them properly.

In order to make it possible, we are willing to clarify any doubt you may have about the institutions included in the list of your choice and make it possible to include any other institution of your interest.

For further information call (5521) 2272-9600 or visit our site <u>www.riskbank.com.br</u>. We are enclosing the full list of the banks included in **RISKbank**[©] and an exemple of an application of the system.
